

PyCon 2012

Grid Job management

Felix Lee, ASGC

About ASGC

Academia Sinica Grid & Cloud

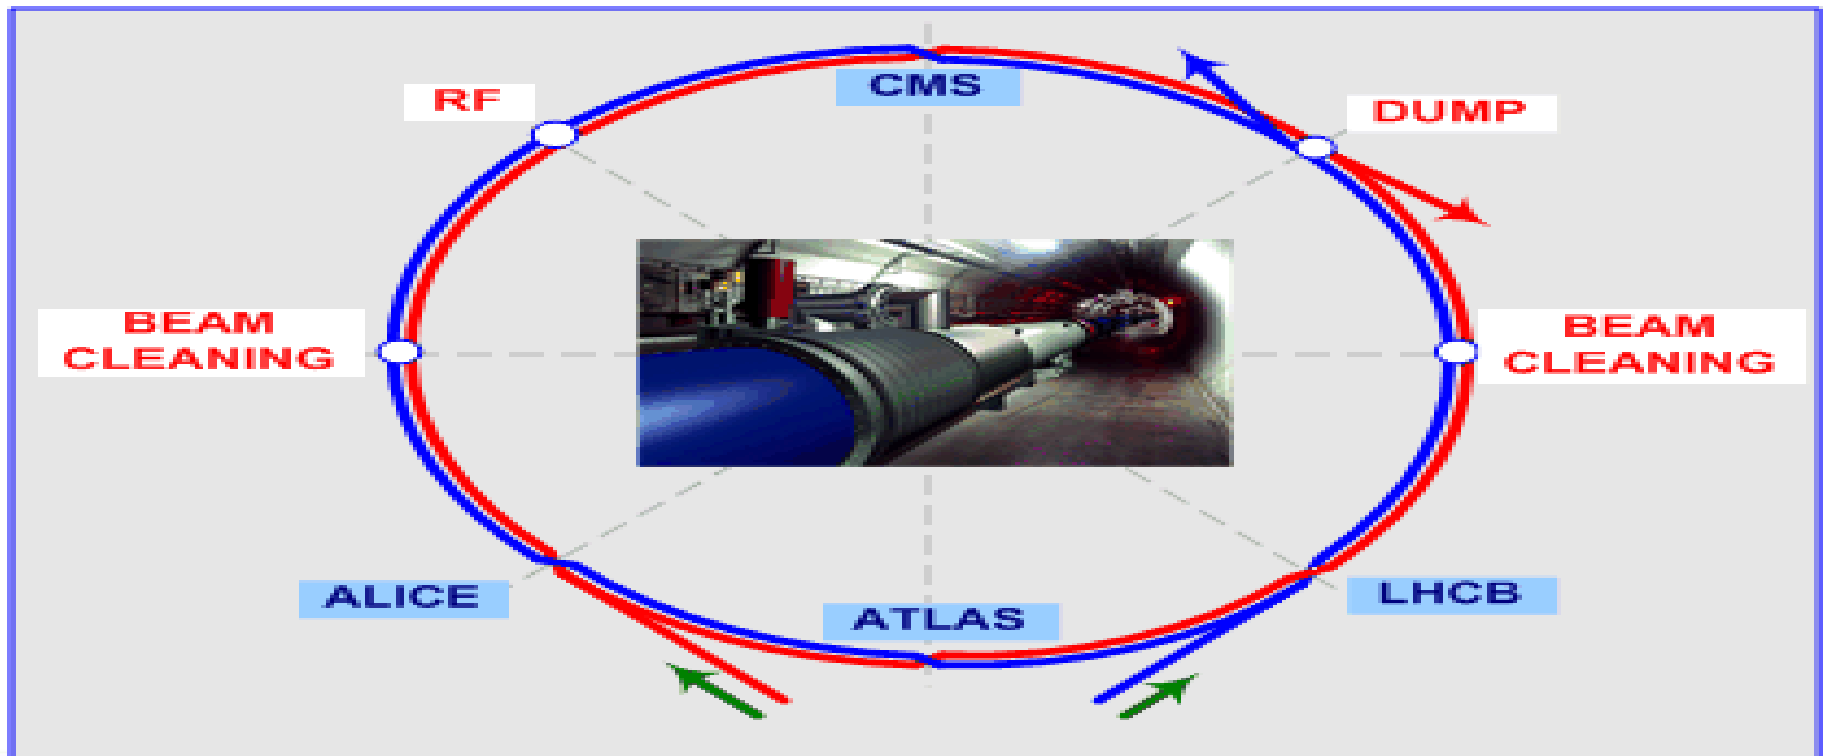

Something we might need to know..

- LHC
- WLCG
- Grid Computing

LHC experiment

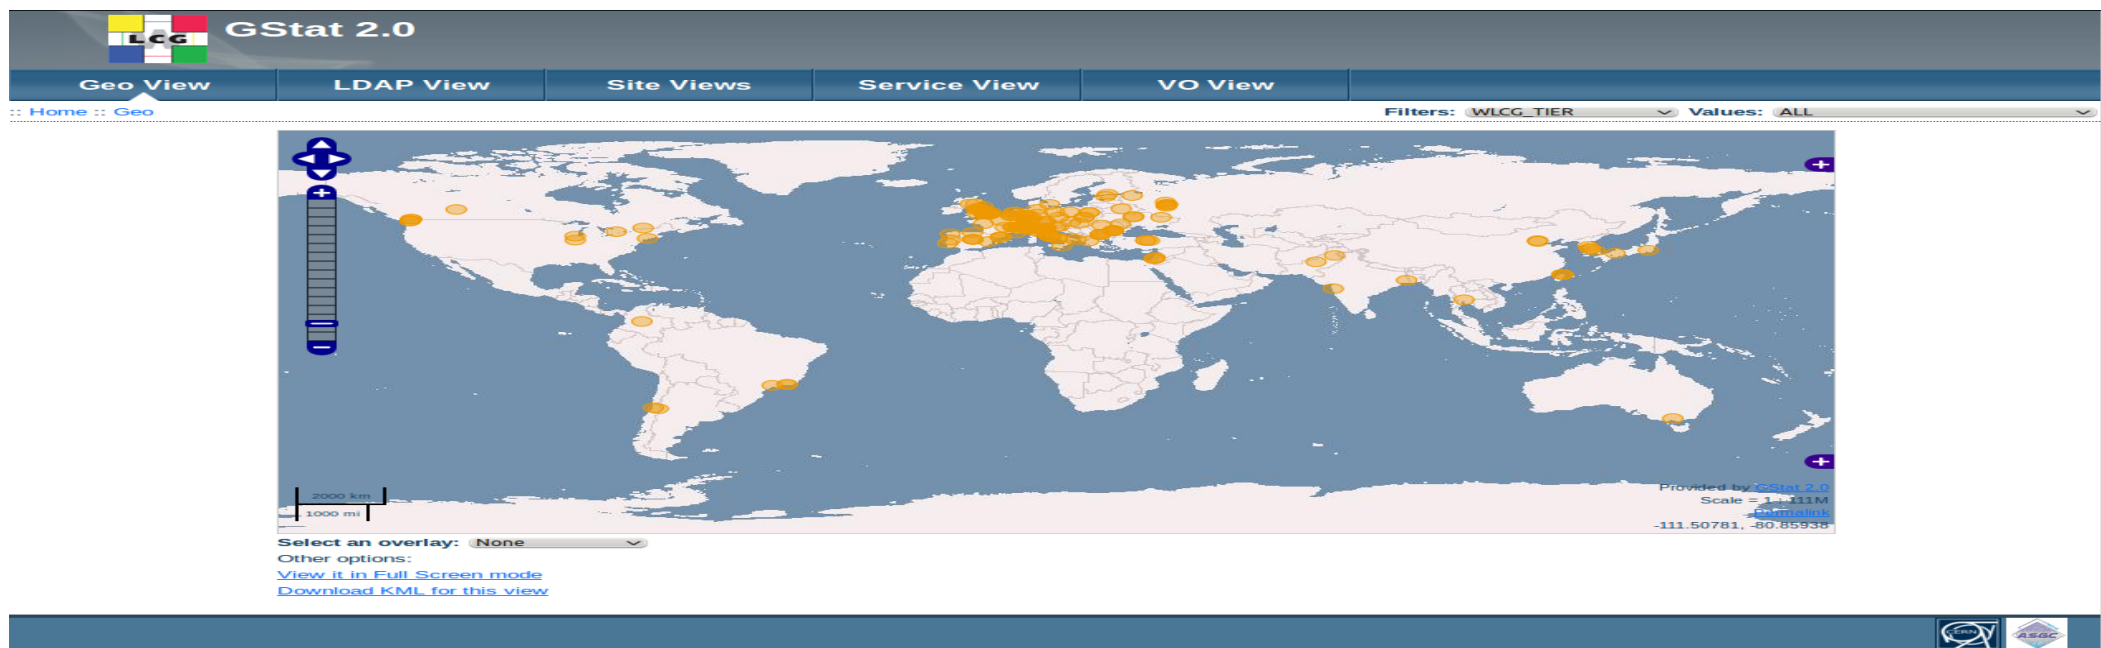

- LHC – The Large Hadron Collider.
 - It was built by European Organization for Nuclear Research (CERN)
 - 27KM tunnel in circumference, as deep as 175M

WLCG

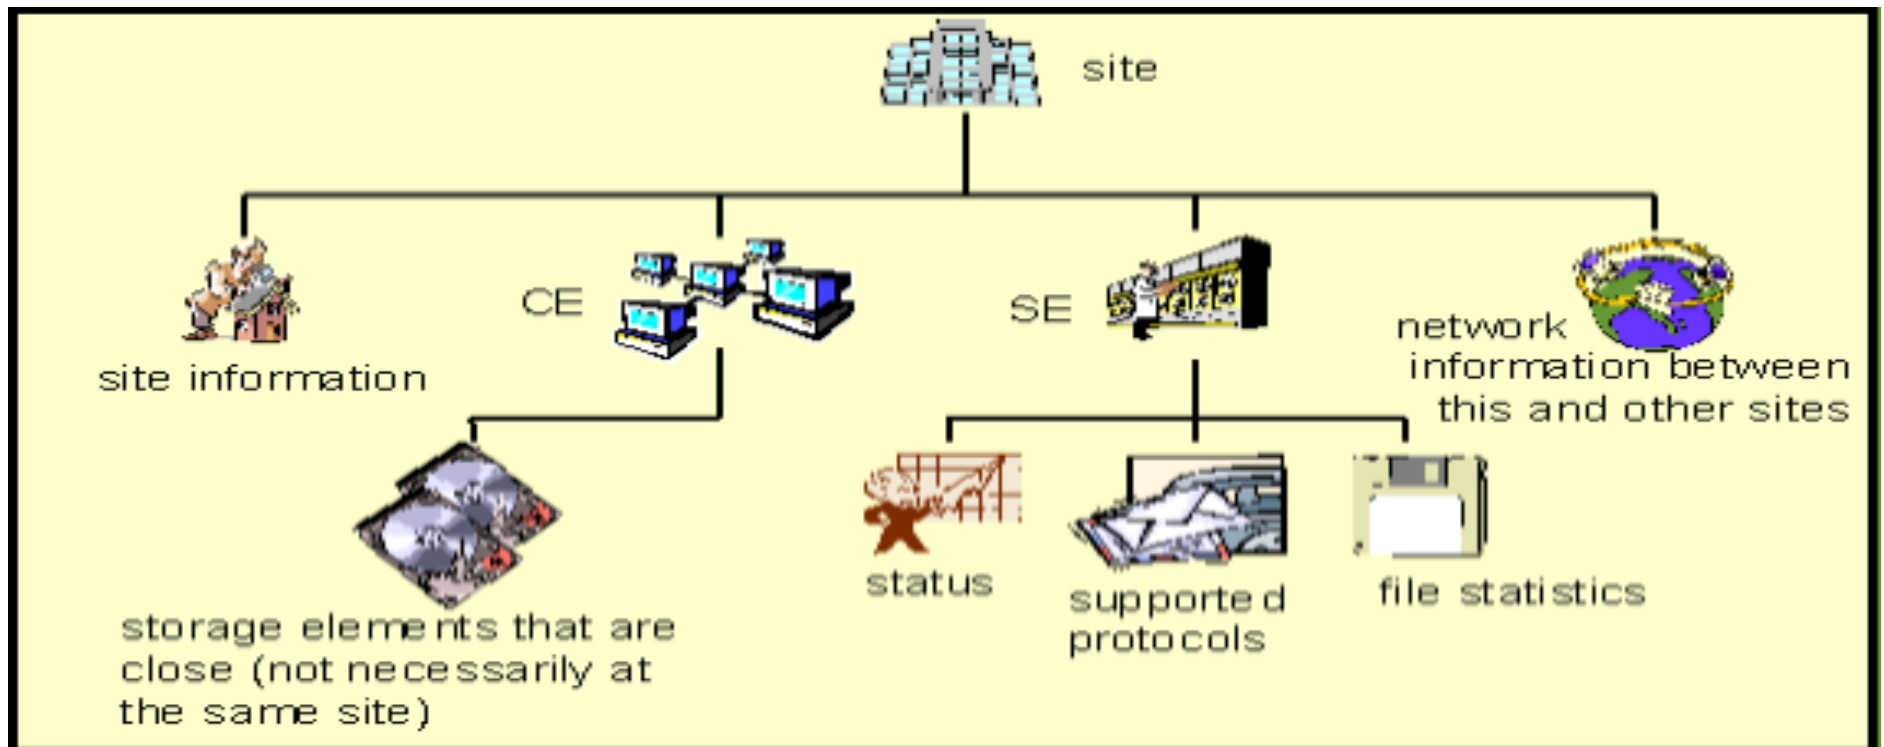

- World-wide LHC Computing Grid
- It's a distributed computing infrastructure to provide the production and analysis environment for LHC experiment.
- Currently, there are 11 tier1, 140 tier2 and several small tier3 in the world.
- There are 269299 CPU cores, 183PB storage capacity in the world.

Grid Computing

- It's one of distributed computing.
- Base on federal resources.
- It connects loosely-coupled computers by the Internet to be super virtual computer.

What we do

- ASGC is WLCG(World-wide LHC Computing Grid) Tier 1 operation center since 2005
- ASGC is also conducting Asia Pacific regional e-Science collaborations, development and infrastructure operation.
- Developing new generation distributed computing infrastructure and technologies.

Python for us

Python in WLCG & Grid

- It's widely used for high level integration.
- Clear code, clear syntax...
- Totally open source.
- Fast and flexible implementing.
 - It's script.
 - No need to be complied.
 - Plenty of mathematic and science modules.

Python in WLCG & Grid

- Work flow & Job Management.
- Data Management.
- Information system.
- Monitoring.
- HEP applications
 - Data processing.
 - Data analysis.

Computing system in WLCG/Grid

- They are all integrated/implemented by Python
 - WMAgent:
 - Workload Manager Agent.
 - GRAB:
 - CMS Remote Analysis Builder.
 - PanDA:
 - Production and Distributed Analysis system.
 - DIRAC:
 - Distributed Infrastructure with Remote Agent Control
 - AliEn:
 - Alice Environment
 - DIANE:
 - Distributed Analysis Environment

Python in ASGC

- Work flow & Job Management
 - GAP 1.0 (base on DIANE)
 - PanDA, collaborating with Atlas
- Monitoring and information
 - GSTAT 2.0, Nagios plugin.
- Integration of Grid & Cloud.
 - Virtual worker node on demand.
 - Virtual machine catalog service.
- Deployment and automation.

GStat 2.0

GStat 2.0

PanDA

The Integrated Grid

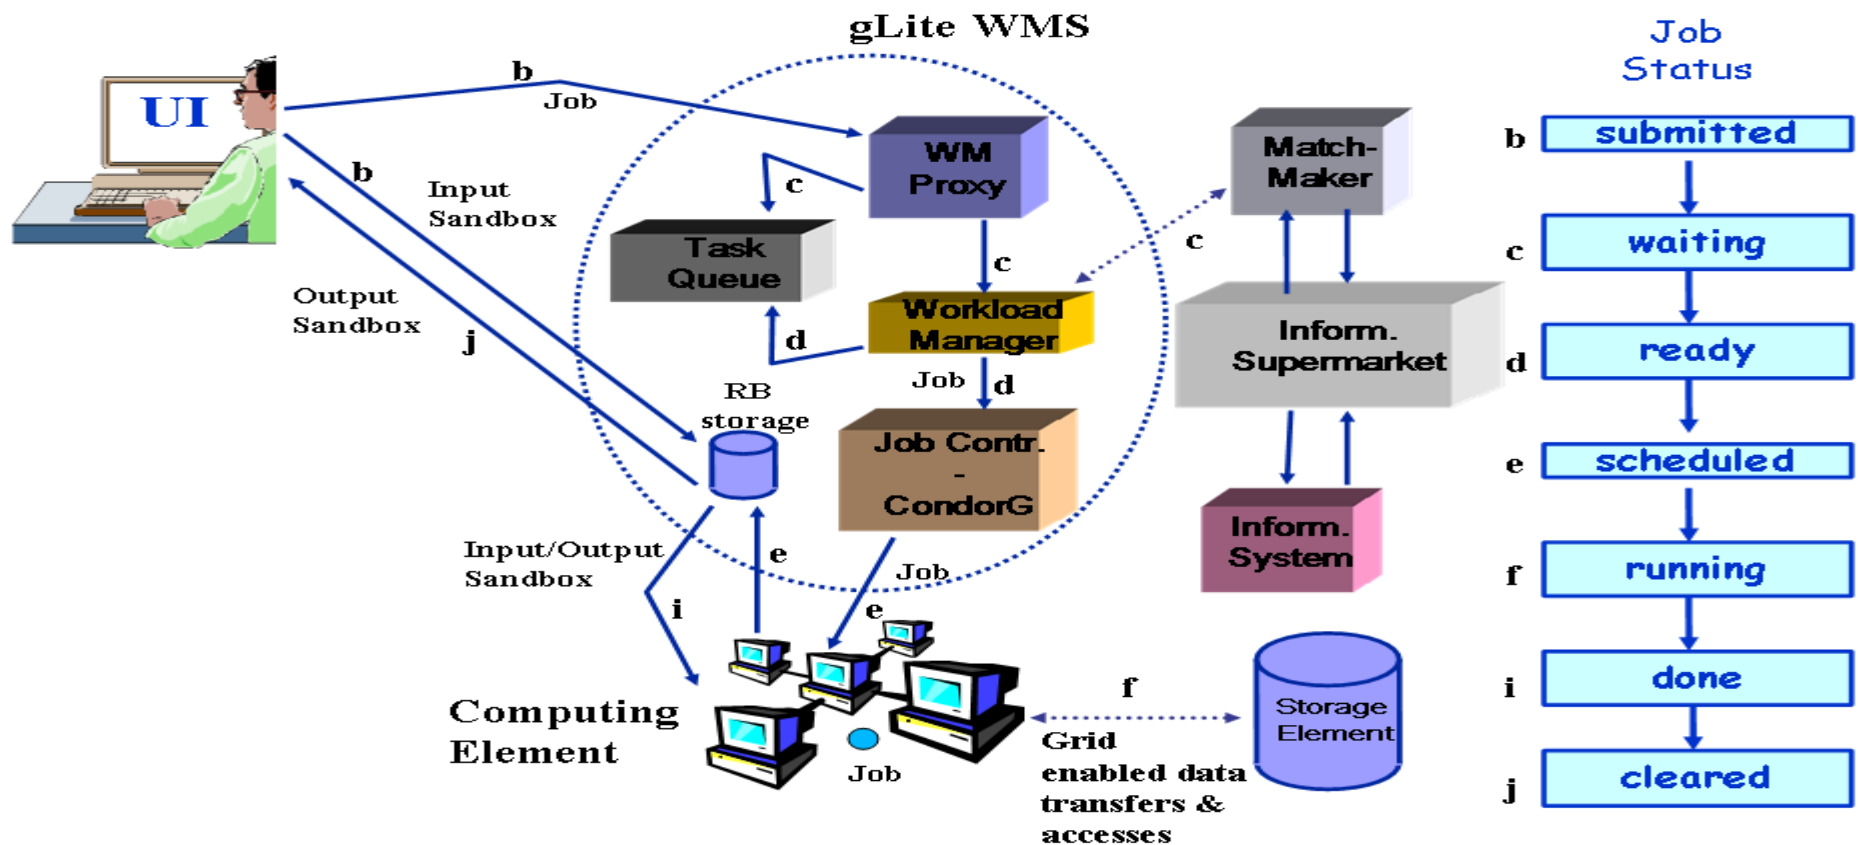

Computing System

with

Python

Work flow & Job management

- A typical Grid workflow

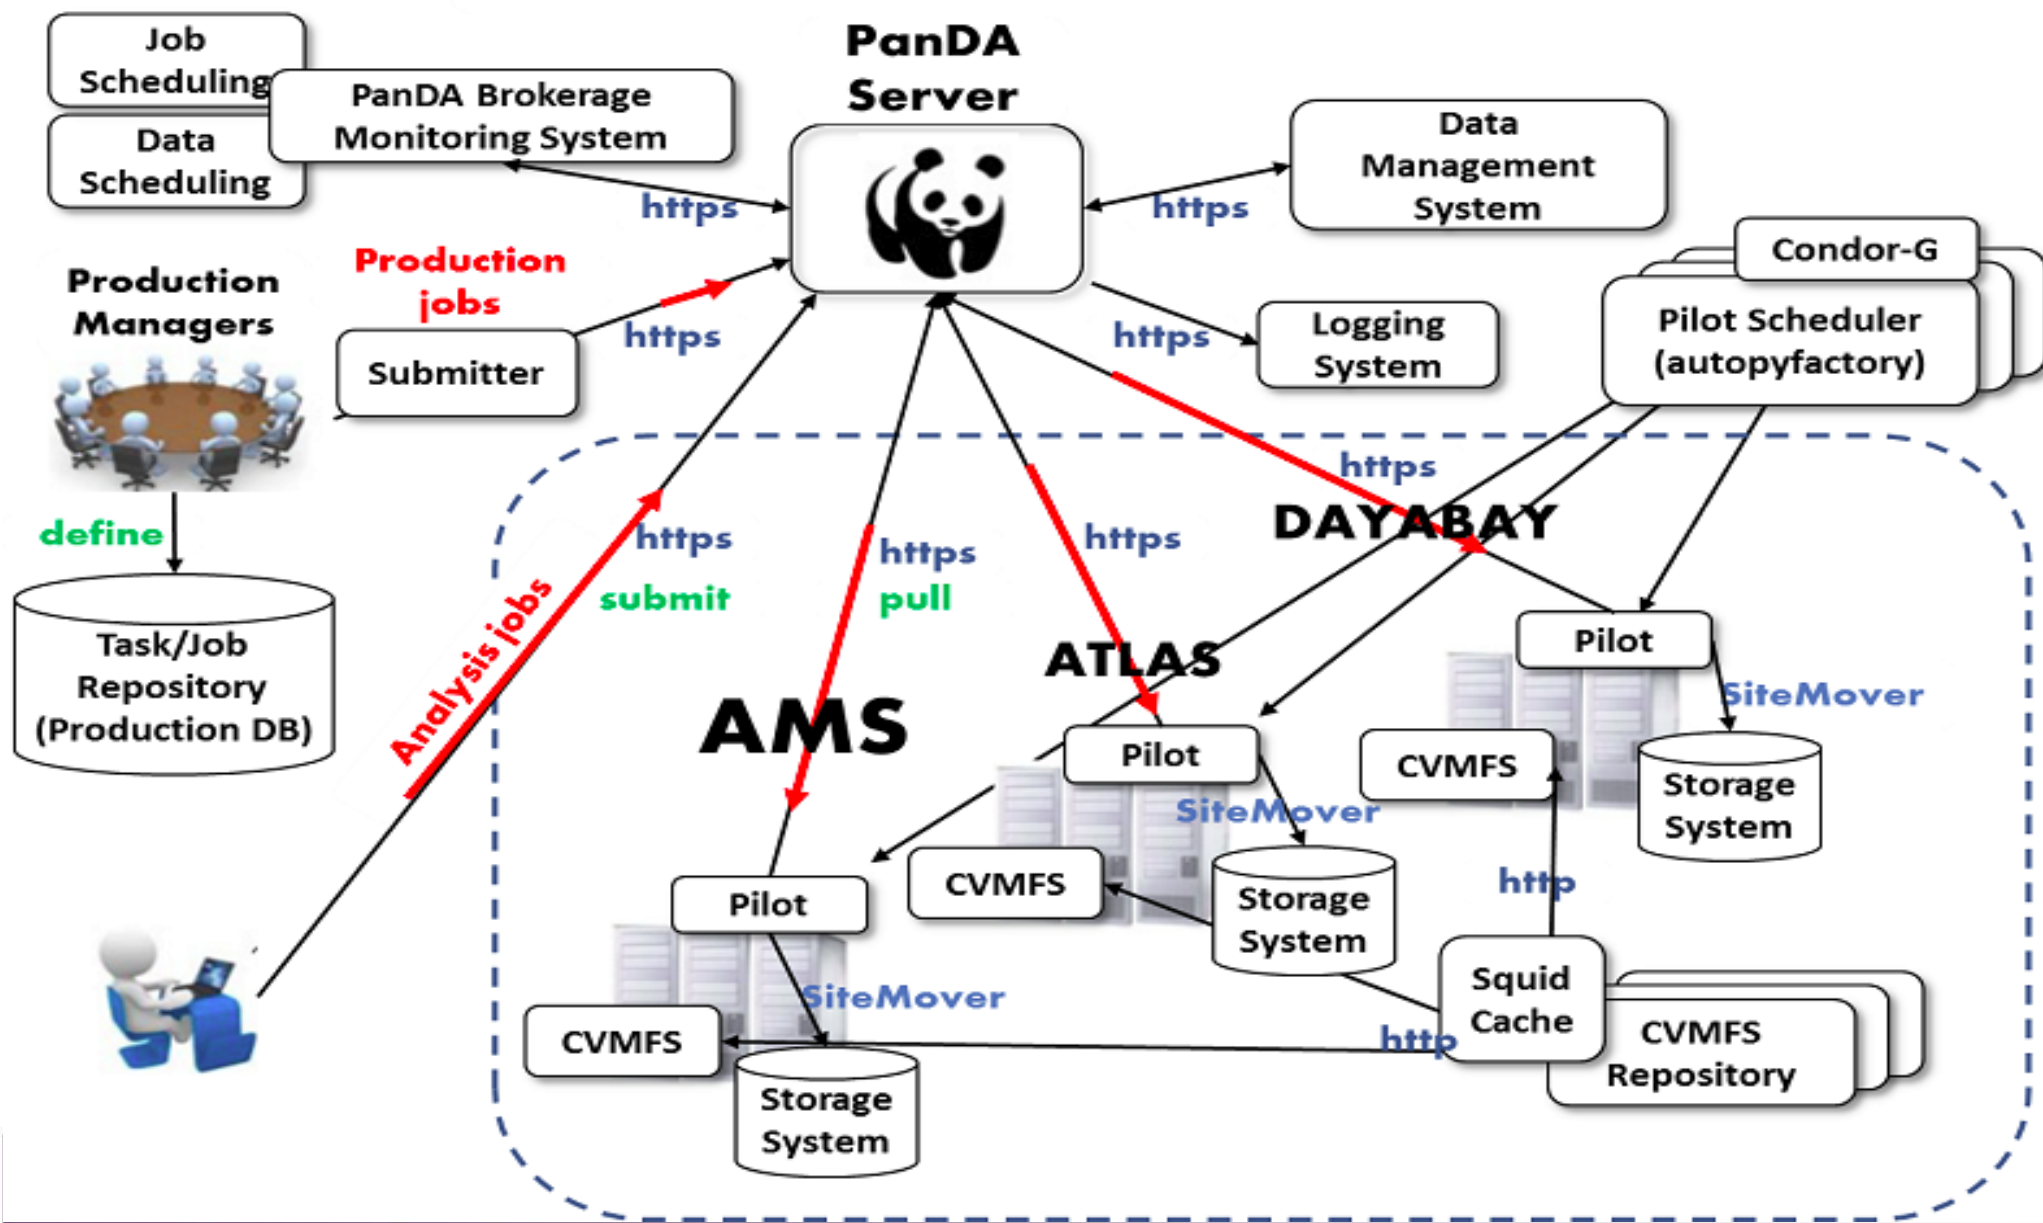

PanDA

- PanDA
 - Production and Distributed Analysis system.
 - Designed and developed by Atlas experiment.
 - It's data driven and pull model computing.
 - Including workflow, resource matchmaking and job management.
 - We are now working with Atlas to improve and deploy it for eScience users.

PanDA diagram

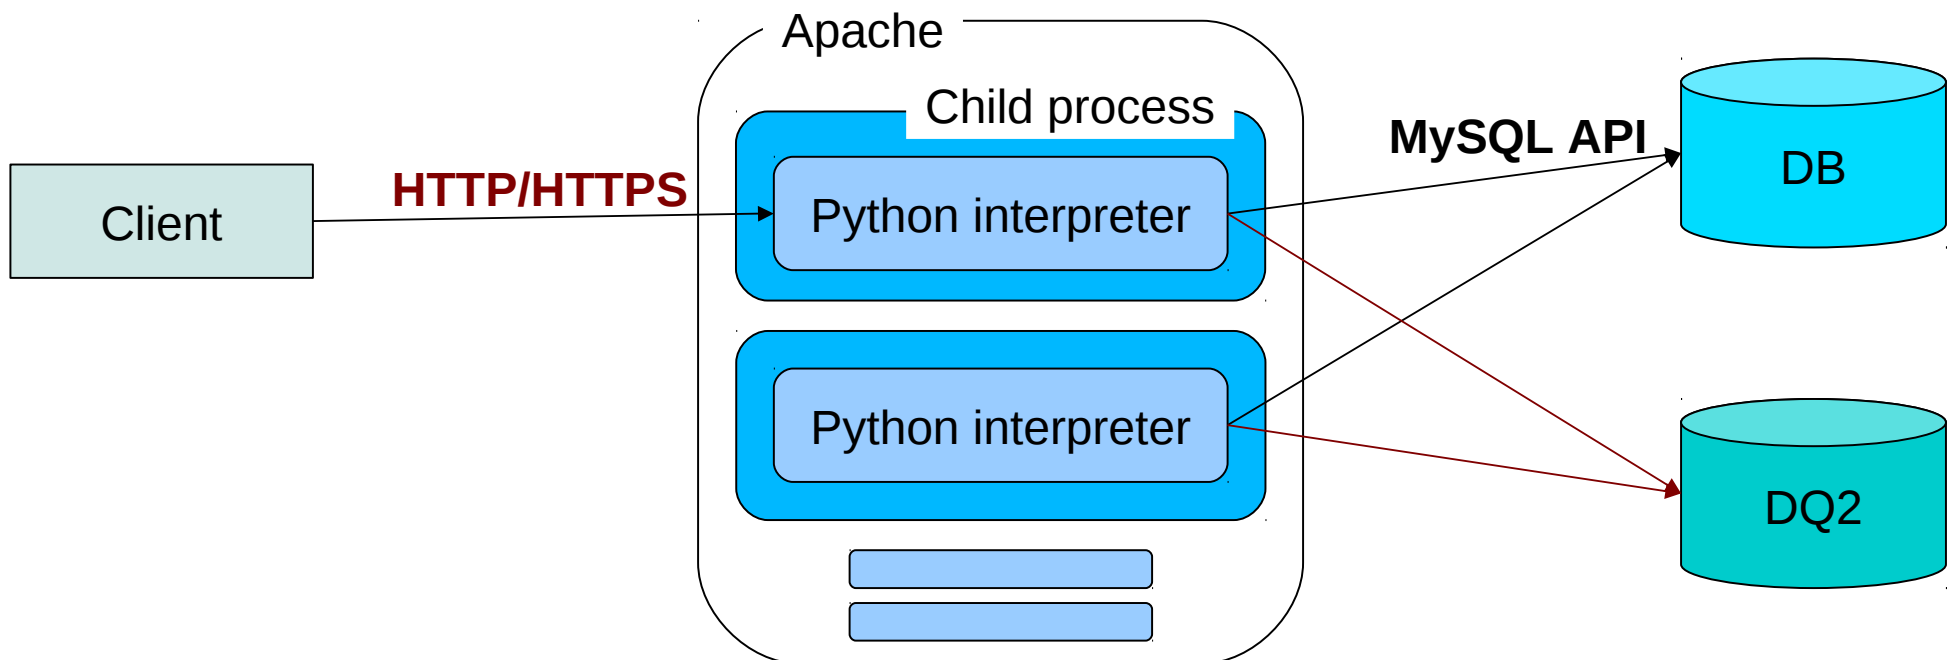

PanDA: Production and Distributed Analysis System

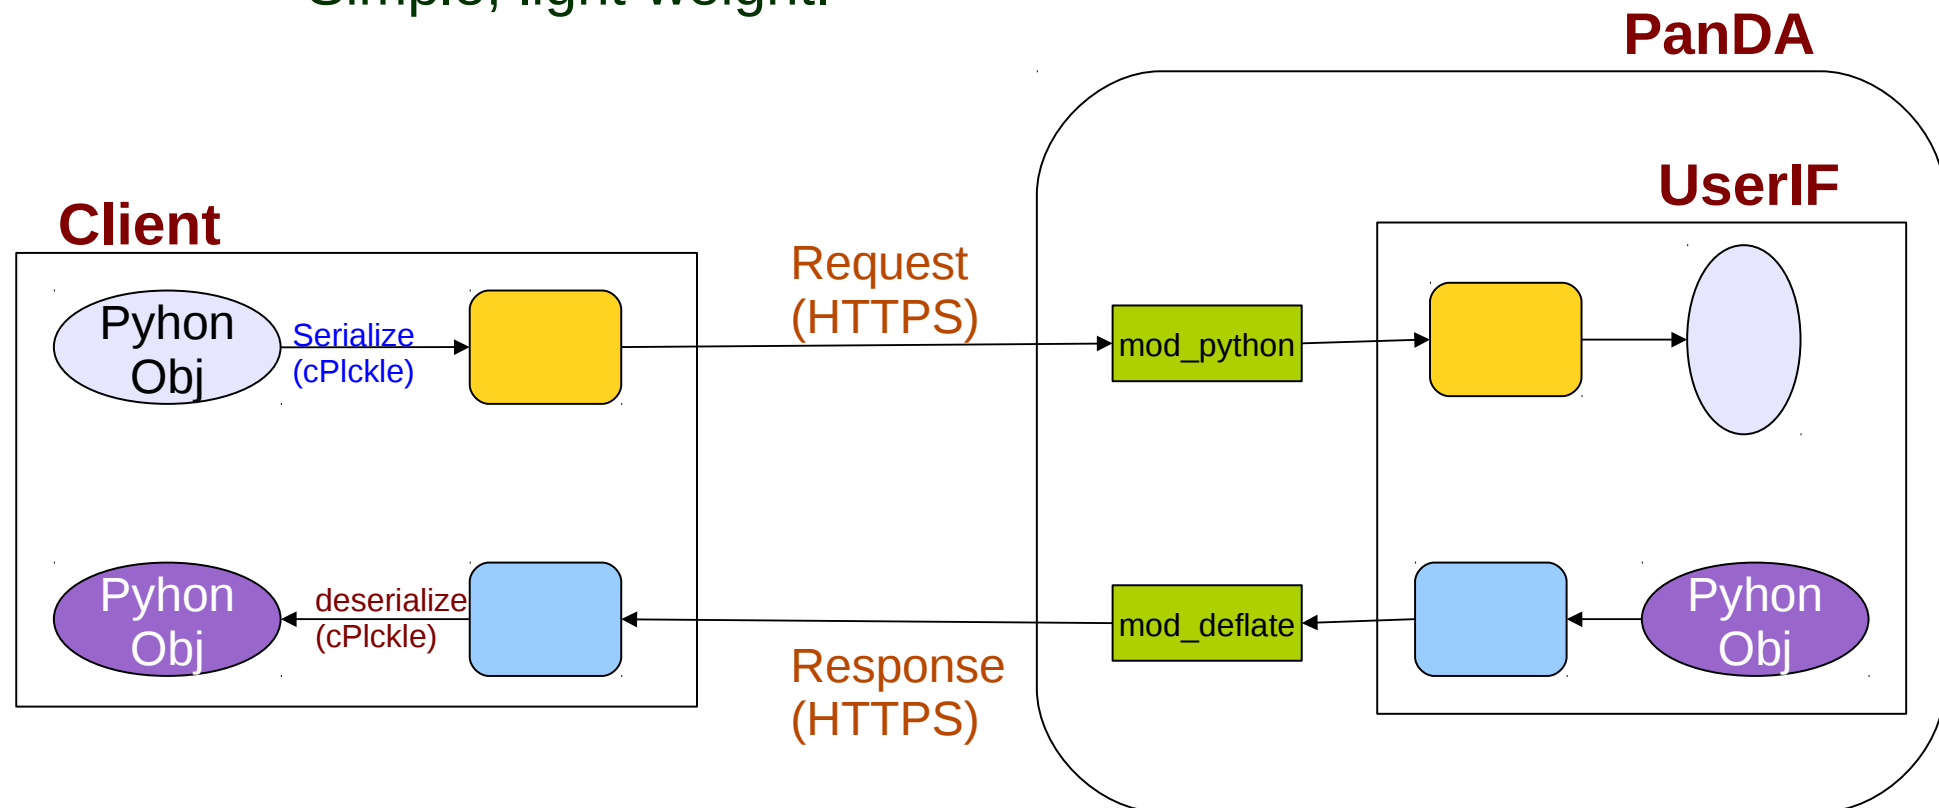

PanDA Server

- PanDA server design
 - Apache-based
 - Communication via HTTP/HTTPS
 - Multi-process
 - Global info in the memory resident database

PanDA Client

- PanDA client
 - Pickle module of python and native curl.
 - Client require python 2.3 or higher, curl and grid-proxy
 - Simple, light-weight.

PanDA screen shot
